Simplicity and quality just got a new name | . singular .

The newly developed loudspeaker model **Singular**, by Altavoz, is the ideal "one-box solution" for all audio and home theatre applications.

By incorporating the EmbracingSound™ technology, Singular replaces every speaker in a conventional stereo- or 5.1 surround setup, as well as offering a superior listening experience.

Mr Thomas Sandell's sophisticated and ground breaking design of the Singular demanded carefully chosen high quality components that were configured into a single box based around the innovative EmbracingSound™ technology.

This all contributes to bring you a brand new concept in quality and simplicity known as Singular, made by Altavoz.

EmbracingSound™

Less is more |

The EmbracingSound™ stereo image allows the listener to exactly define where the sound is coming from. All information reproduced from the system is present in the recording with the philosophy "if it is there you will hear it".

EmbracingSound™ is a single point stereo loudspeaker configuration that can be used with any kind of conventional loudspeaker drivers, flush mounted in immediate proximity of each other on a baffle, separated by a plate element referred to as "the nose". This revolutionary "one-box" approach gives you great advantages, such as elimination of time- and phase errors, greater sound definition, much easier placement and much more.

The system also comprises the EmbracingSound™ Processor, which adapts the stereo signal to our perception and the physical preferences of the loudspeaker configuration. It unmaskes the existing directional information of the recording.

High resolution stereo |

This groundbreaking technology reproduces the complete stereo sound image perfectly from one single point, instead of two or five. EmbracingSound™ is a high resolution enhancement tool for audio reproduction, which creates a better defined sound image with a larger listening area than conventional speakers. It is based on the fact that our sense of hearing has a natural capacity to interpret and localize sound sources around us, as our brain compares the left and the right ear to determine where the sound is coming from. However, the sound illusion given by conventional stereo systems is based on the prejudice that a stereo image requires two strategically placed speakers.

"EmbracingSound™ makes the total sound from the movie reach the listener's senses the way the director intended when we made the movie. It is like being in the theatre even though there is only one single box playing!"
